

Task Summary — AI-Powered Customer Feedback Automation

Project Overview

For this task, I built an **AI-powered customer feedback automation workflow using n8n, Google Forms, Google Sheets, and an AI Agent.**

The workflow starts when a customer submits feedback through a Google Form. The response is automatically added to Google Sheets, which acts as the trigger source for the n8n workflow. The AI Agent then processes the incoming feedback and performs multiple tasks, including **categorizing the feedback, identifying its sentiment, generating a short summary, and drafting a suitable response.**

The AI-generated results are then automatically written back into the corresponding Google Sheets row, eliminating the need to manually analyze and respond to every submission.

Workflow

Google Form

Google Sheets

n8n — Google Sheets Trigger

AI Agent

Category + Sentiment + Summary + Suggested Response

Update corresponding Google Sheets row

Technologies Used

- **n8n** — workflow automation
- **Google Forms** — collecting customer feedback
- **Google Sheets** — storing trigger data and AI results
- **AI Agent / LLM** — analyzing and processing feedback
- **Structured Output Parser** — converting AI responses into usable fields

AI Processing

For each feedback submission, the AI generates:

- **Category** — such as Product, Website, Delivery, Customer Service, or Other
- **Sentiment** — Positive, Neutral, or Negative
- **Summary** — a concise description of the customer's feedback
- **Suggested Response** — a professional and friendly reply

Testing

I tested the workflow with **multiple real Google Form submissions**, including feedback related to delivery and website experience. The workflow successfully detected the new rows, processed the feedback through the AI Agent, and returned structured results for the corresponding spreadsheet entries.

Key Learning

This task helped me understand how AI can be integrated into **real-world business workflows without building a complete application from scratch**. I learned how to connect an event-based trigger with an AI processing step and use the AI's output as an automated action. It also gave me practical experience with **workflow automation, data mapping, triggers, structured AI outputs, and no-code/low-code AI integration**.

N8n workflow

The AI generated fields are added in the google sheet

Test example 1:

Name:

Ali

Email:

ali.test@example.com

Feedback:

I ordered the product last week but the delivery took much longer than expected. The product itself is good, but I would like faster delivery in the future.

Issue Type:

Delivery

Test example 2:

Name: Sarah

Email: sarah.test@example.com

Feedback: The website is very easy to use and I found everything I needed quickly. The checkout process was also smooth.

Issue Type: Website

▼ Dear Ali, thank you for your feedback. We are happy to hear that you are pleased with the product quality! We sincerely apologize for the delay in delivery and will work to improve our shipping speed to provide a better experience for
